General

FABA 100 insulated conductor rails comply with VDE 0100. They satisfy today's requirements for conductor line safety and are protected against accidental contact in compliance with VDE 0470, Part 1 (Safety Class IP 21).

Naturally for the collector this contact protection exists only when the brushes are completely in the conductor rails. Conductor lines systems in the manual area, in which the collector moves out of the conductor rail during operation, require provisions by the customer to prevent accidental contact such as blocking off or switch-off. However this applies only for voltages above 25 VAC or 60 VDC.

Fig. 1 (top right) shows that the VDE finger cannot make contact with the conductive parts.

The insulating shrouding for mounting the conductor rail channel provides good insulation and maximum safety.

Conductor lines with any number of poles can be used. The space requirement is minimal.
The standard delivery length is 5 m, shorter lengths are also available.

The ground conductor is marked with yellow with a continuous green stripe along the insulating shrouding.
Provisions are present to prevent mixing up the collectors for ground and phases.

Use

For interior systems only.
Exterior systems only after consultation.

Fig. 1: VDE-Finger

Approvals

UL approved. Please check when ordering.

Suspension

The maximum suspension interval between compact hangers is 0.8 m, in curves 0.4 m.

Connectors

The conductor rail sections are connected electrically and mechanically with rail connectors. Each joint is protected against accidental contact by a cover.

Expansion

Use only centered, fixed points for straight systems up to 60 m. If the length of the conductor rails is subject to change (caused by variations in the ambient temperature and/or power heat-up) mount the conductor rails in fix point clamps so that they can slide.
On systems over 60 m long and in straight sections between curves provide for expansion points. If both ends of the rail are fixed (switches, elevators), expansion sections are also required.

Feed terminals

Feed terminals are possible as joint feed. Our product line also includes joint caps and isolating assemblies with feed connection possibilities.

Insulated conductor system FABA 100 (General)

Joint caps

Joint caps protect the conductor rail at the end against accidental contact and separate the rails mechanically (switches, elevating stations, etc.). Joint caps are available with and without feed terminals.

Isolating assemblies

Isolating assemblies interrupt the conductor electrically. Operationally driving over collectors for the purpose of connecting or disconnecting the power is permissible only at low power (control currents). We supply isolating assemblies with and without feed terminals for control purposes, in-feed sections, maintenance sections, etc.

Curves

Insulated conductor systems can be used in horizontal and vertical curves. The rails can be bent on site with a special bending tool.

Collectors

The collectors consist of impact-resistant plastic and re-inforced metal parts. The power is drawn with a carbon brush.

The length of the collector connecting cable must not exceed 3 m, when the overload protector is not laid out for the load rating of this connecting cable. See also DIN VDE 0100, Part 430 and DIN EN 60204-32. (Note: The former occurs frequently when a number of collectors are present per system.)

The connecting cables supplied are sufficiently dimensioned for the rated currents specified. It is necessary to take the reduction factors specified in DIN VDE 0298-4 into consideration for other types of laying.

Safety precautions

To avoid pinching hazards it is necessary to ensure that the safety intervals between fixed and moving system parts (0.5 m) are maintained by arranging the conductor rails/conductor lines and collectors/towing arms accordingly at site!

Conductor rail values

Type	Electrical values: Dielectric strength acc. to DIN 53481	Spec. Forward resistance acc. to IEC 60093	Surface-resistance acc. to IEC 60093	Comparison figure/ Tracking acc. to IEC 60112	Application temperature ⁽²⁾	Combustibility

Chemical resistance: ⁽¹⁾ highly resistant to gasoline, oils, weak alkalies and weak acids

⁽¹⁾ Please check with us before using in systems with synthetic oils and greases.

⁽²⁾ Please check separately for applications with continuous temperatures below 0°C (cold storage).

Insulated Conductor Rails FABA 100 (Technical Data)

Section

Part number code

FABA = Insulated Conductor Rails
100 = Current rating in A
25 = Conductor cross section (mm²)
C = Copper conductor

Length

5 m standard length
Shorter lengths possible

Support spacing

For straight sections 0.8 m
In curves 0.4 m

Conductor spacing

Standard = 15 mm

Conductor rails can be bent

at the factory or on the construction site
with special FABA 100 curve tool

Chemical and electrical values:
